

Wire Scratcher

Scratchers can be installed to scrape excessive mud cake deposited over permeable hole sections. These accessories are attached between stop rings, allowing a certain amount of 'travel' during reciprocation of pipe in the cementing stage. The wire and cable types are most commonly used. The design differs according to the casing cementing mode, i.e. whether or not movement (rotation/reciprocation) is exercised during cement displacement and/or prior circulation.

Available sizes are 4-1/2" to 13-3/8". Any special sizes as per customer requirement.
